

DEPLOYMENT DIAGRAMS

System Interaction Diagram

This state machine models the full lifecycle of an Event entity, emphasizing the spontaneous and safety-focused nature of the platform. The event moves from Created to Open/Ready upon system validation, making it visible for recommendations. The subsequent transitions to Active and Completed are triggered automatically by Time Conditions (Start Time and End Time). Crucially, the final state, Archived, is reached only after the event has been Completed and the necessary post-event feedback has been collected and the SafetyScore updated, fulfilling the platform's ethical and safety requirements. The Canceled state is accessible from most active states via creator or admin intervention.

Modular Deployment Diagram

This state machine models the full lifecycle of an Event entity, emphasizing the spontaneous and safety-focused nature of the platform. The event moves from Created to Open/Ready upon system validation, making it visible for recommendations. The transition to Active and then Completed is triggered automatically by Time Conditions (Start Time and End Time). Crucially, the final state, Archived, is reached only after the required post-event feedback is collected and the SafetyScore updated, emphasizing the system's focus on safety and community reliability. The Canceled state is accessible from most active stages via creator or admin intervention.
